The NLR polynucleotide and protein can be used to isolate compounds that bind, (ant)agonise or alter the activity or expression of the NLR. The NLR is a G-protein coupled receptor which is expressed in the central nervous system and shares homology with human neurotensin receptor. The receptors can be used in assays to identify agents for producing anasthesia and analgesia.

      Identifying predicted or actual structures of two chemical or physical library by mass spectrometry correlating molecular mass measurements of two or shared chemical history -
                                                                       WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a human TGR-1 protein. The specification describes a method of screening a compound, which is capable of binding properties of neuromedin U to TGR-1. The method is useful for screening preventatives and remedies for hypertension, stress diseases, etc.. TGR-1 antagonists are also useful for treating the same diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a human TGR-1 protein. The specification describes a method of screening a compound, which is capable of binding properties of neuromedin U to TGR-1. The method is useful for screening preventatives and remedies for hypertension, stress diseases, etc.. TGR-1 antagonists are also useful for treating the same diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to human G-protein coupled receptors, SNORF62 and SNORF72 and their corresponding cDNA molecules. SNORF62 and SNORF72 creceptors are specific for neuromedin U (NMU) neuropetides, hence they are also known as NMU receptors. The agonist and antagonist of NMU receptors are useful for treating an abnormality in a subject that is alleviated by decreasing or increasing the activity of NMU receptor. The NMU receptors serves as a valuable tool for designing drugs which are useful for treating various pathophysiological conditions such as inflammation, arthritis, autoimmune diseases, transplant rejection, graft vs host disease, bacterial, fungal, protozoan and viral infections, septicaemia, AIDS, pain, psychotic and neurological disorders, including anxiety, depression, schizophrenia, dementia, mental retardation, memory loss, epilepsy, neuromotor disorders, respiratory disorders, asthma, cating/body weight disorders including obesity, bulinia, diabetes, and disorders, ischaemia, stroke, cancers, sexual disorders, circadian disorders, renal disorders, troke, cancers, sexual disorders, circadian
                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                   These diseases include peripheral nervous system, psychiatric and central nervous system disorders (e.g. schizophrenia, episodic paroxysmal anxiety, phobia, Parkinson's disease, migraine, epilepsy, bulimia or stroke), cardiovascular diseases (e.g. heart failure, angina pectoris, myocardial infarction or hypertension), dyslipidemias, obesity, emesis, gastrointestinal disorders (e.g. inflammatory bowel disease or motility disorders), osteoporosis, inflammations, infections (e.g. bacterial, fungal, protozoan or viral), pain, cancers, immune disorders, allergies, sepsis or gynecological disorders. Agonists or antagonists of IGS4 are effective with regard to disorders of the nervous system, including the central and peripheral nervous systems, disorders of the gastrointestinal
                                                                                                          central and peripheral nervous systems, disorders of the gastrointestina system, cardiovascular system, skeletal muscle, thyroid, lung or genitourinary system, or immunological disease. The IGS4 polynucleotides are useful as diagnostic reagents for detecting under-expression, overexpression or altered expression of IGS4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New G-protein coupled receptors and the polynucleotides encoding useful for preventing, ameliorating or correcting nervous system disorders, cardiovascular diseases, dyslipidemias, inflammations,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           nervous system disorder; psychiatric disorder; Parkinson's disease; episodic paroxysmal anxiety; phobia; migraine; epilepsy; bulinia; stroke cardiovascular disease; heart failure; angina pectoris; obesity; emesis; motility disorder; myocardial infarction; hypertension; dyslipidemia; gastrointestinal disorder; inflammatory bowel disease; osteoporosis; inflammation; infection; pain; cancer; immune disorder; allergy; sepsis;
                                                                                                                                                                                                                                                                                                                                                                                                  coupled receptor designated IGS4A. IGS4 exists in two polymorphic forms. IGS4A and IGS4B. The IGS4 receptors and IGS4 polynucleotides are useful for preventing, ameliorating or correcting dysfunctions or diseases.
                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 18;

           coupled receptor designated IGS4B. IGS4 exists in two polymorphic forms, IGS4A and IGS4B. The IGS4 receptors and IGS4 polynucleotides are useful for preventing, ameliorating or correcting dysfunctions or diseases. These diseases include peripheral nervous system, psychiatric and central nervous system disorders (e.g. schizophrenia, episodic paroxysmal anxiety, phobia, Parkinson's disease, migraine, epilepsy, bulimia or stroke), cardiovascular diseases (e.g. heart failure, angina pectoris, myocardalal infarction or hypertension), dyslipidemias, obesity, emesis gastrointestinal disorders (e.g. inflammatory bowel disease or motility disorders), osteoporosis, inflammatory immune disorders, allergies, fundada, protozoan or viral), pain, cancers, immune disorders, allergies,

Title: US-09-684-725-2

Perfect score: 1263
1 MEKLQNASWIYQOKLEDPFQ......LLPMTVISVLYYLMALRVSI 242

Pering table: BLOSUM62
Gapop 10.0 , Gapext 0.5

Searched: 112892 seqs, 41476328 residues

Total number of hits satisfying chosen parameters: 112892

Minimum DB seq length: 0
Maximum DB seq length: 2000000000
```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

"Neurotensin receptor type 1.";

Submitted (AUG-1998) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: RECEPTOR FOR THE TRIDECAPEPTIDE NEUROTENSIN.

ASSOCIATED WITH G PROTEINS THAT ACTIVATE A PHOSPHATIDY.

CALCIUM SECOND MESSENGER SYSTEN.

-!- SUBCELLULAR LOCATION: Integral membrane protein.

-!- SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED R:

HIGHEST TO TACHYKININS RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               _MOUSE

Stimulates growth hormone secretion. Binds also other growth hormone releasing peptides (GHRP) (e.g. Met-enkephalin and GHRP-as well as non-peptide, low molecular weight secretagogues (e.g. L-992,429, MK-0677, adenosine) (By similarity). SUBCELLULAR LOCATION: Integral membrane protein. SIMILARITY: BELONGS TO FAMILY 1 OF G-PROTEIN COUPLED RECEPTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SWISS-PROT entry is copyright.
